1   Research Interests

My research interests revolve around the problem of shape perception in computer vision and, more recently, human vision. Much of my recent work focuses on perceptual grouping and its role in image segmentation and shape recovery. I've introduced numerous qualitative shape representations, and their basis in symmetry provides a focus for my perceptual grouping research. My interest in multiscale, parts-based shape representations, and their common abstraction as hierarchical graphs, has motivated my research in inexact graph indexing and matching – key problems in object recognition, another broad focus of my research. My research has also explored many problems related to object recognition, including object tracking, vision-based navigation, content-based image retrieval, language-vision integration, and image/model abstraction.

11.4 Curriculum Development

1. Developed a new half-year graduate course, entitled, "Shape Perception in Human and Computer Vision" (CSC2523). How shape is perceived in the human visual system can both inform and inspire how shape can be represented and recovered in a computer vision system. This interdisciplinary graduate research seminar, suitable for students in human or computer vision, examines shape perception from this dual perspective. Through a discussion of seminal research papers in both human and computer vision, the course explores both classical and current models of shape perception, along with the challenges both communities face.

2. Developed a new full-year course, entitled, "Can We Make a Robot See Like a Human?" (CSC199Y). This multidisciplinary, first-year course explores the challenge of enabling a robot to see more like a human. Students learn some of the basic mechanisms of human vision, and learn how to use basic techniques in computational thinking to model these mechanisms in a machine. A glimpse into the challenges facing human and robot vision provides a lens through which we can better understand what today's robots are capable of, how they're evolving, and what their impact on our society will be.

3. Co-developed a new experiential learning course in image understanding, revolving around group projects defined by the University of Toronto's Intelligent Assistive Technology and Systems Laboratory (IATSL).

4. Developed a new course, entitled, "Graph Matching and Object Recognition." I was invited by Professor Mads Nielsen, IT University, Denmark, to teach a one-week course (during my sabbatical) in the Copenhagen Image and Signal Processing Graduate School. "The school is funded by the participating universities and the Danish Research Training Council. The goal of the school is to assist education of researchers in image processing, signal processing and pattern recognition, by extending and consolidating the research education activities (Ph.D.-courses, workshops, visitors), creating tighter PhD-student networks, and finally by offering a professional infrastructure." I co-taught the course with professor Ali Shokoufandeh (my former Ph.D. student) in May 26-29, 2003, and plan to offer it in the future as an advanced graduate seminar in our own department.

5. Introduced new course (first offered in January, 2007) into the University of Toronto's Department of Computer Science's undergraduate curriculum: CSC420 Introduction to Image Understanding.

6. Introduced new course (first offered in January, 2001) into the University of Toronto's Department of Computer Science's graduate curriculum: CSC2523: Object Modeling and Recognition. This course replaced CSC2523: Computational Vision II, and focuses on the issues surrounding the problem of object recognition.

7. Introduced new course into the Rutgers University Department of Computer Science's graduate curriculum: 16:198:534 Image Understanding.

8. Co-developed the *Proseminar in Cognitive Science*, a core course required for the Cognitive Science Graduate Certificate Program. It is team-taught by the RuCCS faculty.

9. Co-developed *Cognitive Science: A Multidisciplinary Introduction*, a core course required for the Undergraduate Cognitive Science Minor. It is team-taught by the RuCCS faculty.
